This invention describes a novel method (I) for detecting whether an individual is sensitive to Dermatophagoides (house dust mites). The method involves detecting sensitivity to house dust mites). The comprising combining a blood sample from the individual with 1 or more isolated T cell epitopes of the protein allergens I and II (Up I) and (DP II)) from Dermatophagoides (house dust mites). 32 T cell epitopes (with varying) defined amino acids sequences (given in the specification) may be used in (I). The sample and allergens are combined under conditions appropriate for the binding of blood components with the polypeptides. The extent of binding is then indicative of the sensitivity of the patient to house dust mites. (I) may be used to screen individuals for sensitivity to Dermatophagoides (house dust mites). The house dust mite is a major cause of a variety of allergic disorders such as asthma, rhinitis and ectopic dermatitis. Adv950360-Y50542 and Adv50546-Y50555 represent house dust mite allergen peptide fragments derived from Der P I, Der I II, Der I I and Der I II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó

                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method (I) for detecting whether an individual is sensitive to Dermatophagoides (house dust mites). The method involves detecting sensitivity to house dust mites in patients, comprising combining a blood sample from the individual with 1 or more isolated T cell epitopes of the protein allergans I and II ((DP I) and (DP II)) from Dermatophagoides (house dust mites). 32 T cell epitopes with varying, defined amino acids sequences (given in the specification) may be used in (I). The sample and allergens are combined under conditions appropriate for the binding of blood components with the polypetides. The extent of binding is then indicative of the sensitivity of the patient to house dust mites. (I) may be used to screen individuals for sensitivity to Dermatophagoides (house dust mites). The house dust mite is a major cause of a variety of allergic disorders such as asthma, rhinitis and ectopic dermatitis. AAY50360-Y50542 and AAY50346-Y50555 represent house dust mite II. Der f II and Der f II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                            Screening individuals for allergic reactions to T cell epitopes of major allergens from house dust mites.

The invention relates to an isolated peptide of the major protein allergens of the genus Dermatophagoides, which comprises at least one cell group of a protein allergen from Der p (DP) I, DP II, Der f (DP) I or DF II. The isolated peptide comprises at least two regions, each region comprising at least one T cell group of a protein allergen of the genus Dermatophagoides. The regions are derived from the same or different protein allergens of the genus Dermatophagoides. The peptides are useful for treating house dust mite allergy in humans. The peptides are also useful for detecting or diagnosing sensitivity to house dust mite protein allergens. The present peptides have similar or enhanced therapeutic properties as the naturally-occurring allergen, but have reduced side effects, and increased solubility and stability. The present sequence represents an allergenic T-cell epitope containing peptide derived from the Dermatophagoides allergenic proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptides comprising T cell groups of the major allergens from Dermatophagoides (house dust mites), useful for treating house dust mite allergy in humans, and for diagnosing sensitivity to house dust mite protein allergens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Franzen HM, Chen X;

Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.
                                                                                                                                                                                                                                                                                                   The peptide is one of a series of overlapping peptides synthesised by standard techniques to cover the whole Dermatophagoides farinae Def pl sequence. The T cell epitopes of the protein were mapped by detection of the peptide s ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitive individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, anlergens. The peptides may be modified for e.g. increasing solubility, enhancing therapeutic or preventive efficacy or stability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated peptide of the major protein allergens of the genus Dermatophagoides, which comprises at least one T cell group of a protein allergen from Der p (DP) I, DP II, Der f (DF) I or DF II. The isolated peptide comprises at least two regions, each region comprising at least one T cell group of a protein allergen of the genus Dermatophagoides. The regions are derived from the same or different protein allergens of the genus Dermatophagoides. The peptides are useful for dreating house dust mite allergy in humans. The peptides are also useful for detecting or diagnosing sensitivity to house dust mite protein allergens. The present peptides have similar or enhanced reduced side effects, and increased solubility and stability. The present sequence represents an allergenic T-cell epitope containing peptide derived from the Dermatophagoides allergenic proteins
                                                                                                                                                                                                                                                                                                                                                                                                    Peptides comprising T cell groups of the major allergens from Dermatophagoides (house dust mites), useful for treating house dust mite allergy in humans, and for diagnosing sensitivity to house dust mite
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

RESULT 14 AAR36448

ð q ö

The peptide is one of a series of overlapping peptides synthsised by standard techniques to cover the whole Dermatophagoides pteronyssinus Der pi sequence. The Tcell epitopes of the protein were mapped by detection of the peptide's ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity. The peptides may allergans. When administered to house dust mite sensitive individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, and paraget of the peptides are capable of modified for e.g. increasing solubility, allergans and ARR36666700 and AAR36398-490. (Updated on 25-MAR-2003 to correct PN field.) X0000000000000X8

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WPI; 2002-750636/81.

Antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or nucleic acid coding for the allergen.

Claim 14; Page 11; 32pp; French.

The invention relates to antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or histamine audience that has at least one polymucleotide sequence coding for the allergen, together with a pharmaceutical carrier. The pharmaceutical composition of the invention is useful as a non-specific antiallergic treatment, and also useful in the treatment of allergic hypersensitivity, allergic asthema, allergic restinity, allergic sethema, allergic rhinitis, and allergic and acopical eczema. This sequence represents a peptide of a cysteine protease epitope region relating to the antiallergic

compositions of the invention

```
canonical Haemonchus contortus cysteine proteinase molecule which were used in the design of the primers given in AAQ94240-43. These primers were used in the cloning of OMA fragments from the cysteine protienase gene, such as DW.1, DW.2, DM.3, DW.4, DW.4 and DW.5 (see also AAQ94246-51). The amplified fragments may be expressed in a recombinant cell for the production of antigens. These antigens may be used in the preparation of a vaccine against helminth parasites in a human or non-human animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protective helminth parasite antigen - used in vaccine directed against parasitic nematodes of mammalian gastro-intestinal tract e.g. Haemonchus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  dihydropyridins/pyridinium salt type redox moiety, retina, lipophilic, antidiabetic; ophthalmological, diabetic retinopathy; growth factor inhibitory activity; somatostatin; somatostatin analogue; octreotide; lanreotide; sequential metabolism; insulin dependent diabetes mellitus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an antiallergic pharmaceutical composition (1) comprising a pharmaceutical carrier containing an active agent combination of at least two off an allergen; an antihistamine; and a histamine synthesis inhibitor. (1) is used for treating or preventing allergic thypersensitivity reactions, especially allergic asthma, allergic rhintits or allergic eczema, in babies, children or adults. The present sequence is a peptide fragment (epitope) of cysteine protease from Dermatophagoides pteronyssinus, which was used as an allergen in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antiallergic composition, useful for preventing and treating e.g. asthma, rhinitis or eczema, containing at least two of allergen, antihistamine and histamine synthesis inhibitor.
                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention describes peptide derivatives (I) comprising a dihydropyridine/pyridinium salt type redox molety for targeting peptides to the retina, a bulky lipophilic function and an amino cid/dipeptide/tripeptide spacer. Also described: (I) the preparation of (I), and (2) intermediate quaternary salts (II). (I) have antidiabetic and ophthalmological activities. (I) can be used in the treatment or prevention of diabetic retinopathy by delivery of peptides with growth factor inhibitory activity (e.g. somatostatin analogues such as octreotide and lanreotide) to the retina by sequential metabolism. It is curiable and lanreotide) to the retina by sequential metabolism. It is curiable and lanreotide to the retina by sequential metabolism. It is cuiabetes mellitus patients for critical periods in diabetic retinopathy disease progression before laser photocoagulation is indicated, or negative diabetic retinopathy or is found to have low risk diabetic retinopathy. The present sequence represents a somatostatin analogue peptide, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                               New peptide derivatives with redox targetor moiety are useful in the treatment of diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Somatostatin analogue peptide SEQ ID NO:59.
                                                                                                                                                                                                                                                                                                                                                                           Example 6; SEQ ID NO 60; 186pp; English.

dihydropyridine/pyridinium salt type redox moiety; retina; lipophilic; antidiabetic; ophthalmological; diabetic retinopathy; growth factor inhibitory schivity; somatostatin; somatostatin analogue; octreotide; lanreotide; sequential metabolism;
```

The present invention describes peptide derivatives (I) comprising a dipyration-pyridine pyridinium salt type redox monety for targeting peptides to the retina, a bulky lipophilic function and amino acid/dipeptide/tripeptide spacer. Also described: (I) the preparation of (I), and (2) intermediate quaternary salts (II). (I) have antidiabletic and ophthalmological activities. (I) can be used in the treatment or prevention of diabetic retinopathy by delivery of peptides with growth factor inhibitory activity (e.g. somatostatin analogues such as certectide and larrectide) to the retina by sequential metabolism. It is envisaged that (I) will be useful in the treatment of insulin dependent disease progression before laser photocoagulation is indicated, preferably for 1-4 month intervals when a patient is experiencing severe innopathy of insulations and indeptic retinopathy disease progression before laser photocoagulation is indicated, analogue peptide, which is used in the exemplification of the present redox targetor moiety are useful in the Example 6; SEQ ID NO 59; 186pp; English. tuberculosis antigens, and the polynuclectide sequences encoding them. The sequences of the invention are useful in a method for preventing The sequences of the invention are useful in a method for preventing protein or the polynuclectide that encodes the fusion protein. Also disclosed is a pharmaceutical composition comprising the fusion protein or the polynuclectide sequence encoding it. The fusion protein induces an immune response to M. tuberculosis and can be used in the diagnosis, prevention, and treatment of tuberculosis infection. The present sequence represents a flexible polylinker peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          dihydropyridine/pyridinium salt type redox moiety; retina; lipophilic; antidiabetic; ophthalmological; diabetic retinopathy; growth factor inhibitory activity; somatostatin; somatostatin analogue; octreotide; lanreocide; sequential metabolism; insulin dependent diabetes mellitus.
                                                                        New fusion proteins of Mycobacterium tuberculosis for diagnosing, preventing or treating tuberculosis infection or in enhancing immune responses in M. tuberculosis.
                                                                                                                                                                                   The present invention relates to fusion proteins of Mycobacterium

                                                                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of polynucleotide sequences encoding Mycobacterium tuberculosis antiganic polypeptides. The polynucleotide sequences of the invention are useful for treating, preventing, and diagnosing M. tuberculosis infection, for producing M. tuberculosis secretory polypeptides, for producing DNA vaccines, for presence of bacteria in a biological sample, for inducing and/or enhancing immune responses to M. tuberculosis, and in gene therapy. BABS5784 represent flexible polylinker peptides. Note: The present sequence is given in the Sequence listing but is not mentioned elsewhere in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             M. tuberculosis fusion protein associated flexible polylinker peptide #2.

Sequence 10 AA

883333

drugs for drug discovery and as lead ligands for drug design development. The present sequence is a complementary peptide Saccharomyces cerevisiae

```
The present invention describes peptide derivatives (1) comprising a dihydropyridine/pyridinium salt type redox moiety for targeting peptides to the retine, a bulky lipophilic function and an amino coid/dipeptide/tripeptide spacer. Also described: (1) the preparation of (1); and (2) intermediate quaternary salts (II). (I) have antidiabetic and opthalmological activities. (I) can be used in the treatment or prevention of diabetic retinopathy by delivery of peptides with growth factor inhibitory activity (e.g. somatostatin analogues such as octraotide and lanreotide) to the retina by sequential metabolism. It is envisaged that (1) will be useful in the treatment of insulin dependent diabetes mellitus patients for critical periods in diabetic retinopathy disease progression before laser photocoagulation is indicated, preferably for 1-4 month intervals when a patient is experiencing severe con-proliferative diabetic retinopathy or is found to have low risk diabetic retinopathy. The present sequence represents a somatostatin analogue peptide, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying complementary peptides by analysis of protein and nucleotide sequence databases, useful in drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Saccharomyces cerevisiae; complementary peptide; peptide identification; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
de derivatives with redox targetor moiety are useful in the of diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

Calpain is a human leukocyte derived calitum dependent cysteline procease, which can be used to screen for compounds that activate or inhibit its proteolytic activity. Calpain DNA can be used to treat or prevent cancer, cerebral apoplexy, cerebral infarction, subbarachnoid haemorrhage, Alzheimer's disease, myodystrophy, cataracts, ischaemic heart disease, atheresis, arthritis or collagen disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a number of peptide nucleic acids (PNAs) capable of binding to a cell surface receptor, where the oligomer and the peptide are linked by a chemical bond or an amino acid linker. The oligomer may have a polyamide, polythicamide, polysulfinamide or polysulfonamide backbone. The PNAs of the invention can be used in therapy, including the treatment of infections, cancer, autoimmune diseases, renal failure, endocrinological disorders, acromegaly, neurological diseases and sickle cell anaemia. The present sequence is an example of a peptide for use in a PNA
                                                                                                                                                                                                                                                                                                                                                                   Novel conjugate, useful for killing pathogenic organisms and for inhibiting gene expression, comprising a peptide nucleic acid oligomer conjugated to ligand capable of binding to a cell surface receptor via a chemical bond or linker.
                                                                                     Peptide nucleic acid, PNA, therapy, infection, cancer, restenosis, asthma, autoimmune disorder, endocrinological disorder, renal failure, neurological disease, acromegaly, sickle cell anaemia,

The present invention discloses new human HCCAl protein, the polynucleotides encoding the polypeptide and the recombinant process to produce the polypeptide. The present invention also discloses the method of applying the medicine composite of the polypeptide in treating liver cancer and other diseases. The present invention also discloses the preparation process of HCCAl protein specific antibody and its application in diagnosing and treating diseases. The present invention also discloses the application of the polynucleotides encoding the new HCCAl protein. The present sequence represents a peptide sequence relating to human HCCAl protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polylinker peptide #2 relating to invention of M. tuberculosis antigens.
                                                                                                                                                                                                                                                                                                                                                                                                        New liver cancer up expressing gene for treating liver cancer and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to the isolation of polynucleotide sequences encoding Mycobacterium tuberculosis antigenic polypeptides. The polynucleotide sequences of the invention are useful for treating, preventing, and diagnosting w. tuberculosis infection, for producing w. tuberculosis infection, for producing w. tuberculosis infection, for producing w. tuberculosis correctory polypeptides, for producing DNA vaccines, for presence of bacteria in a biological sample, for inducing and/or enhancing immune responses to M. tuberculosis, and in gene therapy. BNDS5749-ABDES5749 represent flexible polylinker peptides. Note: The present sequence is given in the Sequence listing but is not mentioned elsewhere in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 M. tuberculosis fusion protein associated flexible polylinker peptide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New fusion proteins of Mycobacterium tuberculosis for diagnosing, preventing or treating tuberculosis infection or in enhancing immune responses in M. tuberculosis.
                                                       Novel isolated mycobacterial polynucleotide, useful for treating, preventing or diagnosing Mycobacterium tuberculosis infection, for producing Mycobacterium tuberculosis secretory polypeptides and DNA vaccines.
                                                                                                                                                                                                                                                                                                                                                                                             .

                                    tuberculosis antigens, and the polynuclectide sequences encoding them. The sequences of the invention are useful in a method for preventing truberculosis by administering to a subject an amount of the fusion protein or the polynuclectide that encodes the fusion protein. Also disclosed is a pharmaceutical composition comprising the fusion protein or the polynuclectide sequence encoding it. The fusion protein induces an immune response to M. tuberculosis and can be used in the diagnosis, prevention, and treatment of tuberculosis infection. The present sequence represents a flexible polylinker peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           note= "optionally 4-methoxybenzyl-Cys, optionally D-form

                                                                                                                                                                                                                                                                                                  g
```

WPI; 2001-342005/36.

The present invention provides a number of peptide nucleic acids (PNAs) capable of binding to a cell surface receptor, where the oligomer and the peptide are linked by a chemical bond or an amino acid linker. The oligomer may have a polyamide, polythicamide, polysulfinamide or polysulfonamide backbone. The PNAs of the invention can be used in therapy, including the treatment of infections, cancer, autoimmune diseases, renal failure, endocrinological disorders, acromegaly, neurological diseases and sickle cell anaemia. The present sequence is an example of a peptide for use in a PNA Novel conjugate, useful for killing pathogenic organisms and for inhibiting gene expression, comprising a peptide nucleic acid oligomer conjugated to ligand capable of binding to a cell surface receptor via a chemical bond or linker. Claim 14; Col 19; 25pp; English.

Sequence 59, Application US/09144991B
Patent No. 6440933
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: BARTOLOMEO, Maria
TITLE OF INVENTION: COMPOUNDS AND METHOD FOR THE PREVENTION AND TREATMENT
TITLE OF INVENTION: OP DIABETIC RETINOPATHY
FILE REFERENCE: 028724-109
CURRENT APPLICATION NUMBER: US/09/144,991B
CURRENT FILING DATE: 1998-09-01
PRIOR PLING DATE: 1997-09-10
NUMBER OF SEQ ID NOS: 65
SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FEATURE:
NAME/KEY: BINDING
LOCATION: (1)
OTHER INFORMATION: Amino acid 1 is attached by Trig.
NAME/KEY: BINDING
LOCATION: (7)
OTHER INFORMATION: (7)
OTHER INFORMATION: (3)..(6)
OTHER INFORMATION: (2)..(6)
OTHER INFORMATION: Cysteine residues at positions 3 and 6 are
OTHER INFORMATION: Description of Unknown Organism:peptide derivative

Parent No. 6440931
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL PAPELICANT:
BARTOLOMEO, Maria
TITLE OF INVENTION: COMPOUNDS AND METHOD FOR THE PREVENTION AND TREATMENT
TITLE OF INVENTION: OF DIABETIC RETINOPATHY
FILE REPERENCE: 028724-109
CURRENT PELLING NAMER: US/09/144,991B
CURRENT FILING DATE: 1998-09-01
PRIOR APPLICATION NUMBER: US 60/058,423
PRIOR APPLICATION NUMBER: US 60/058,423
PRIOR PRIOR OF SEQ ID NOS: 65
SOFTWARE: PATENTIN VET: 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   JUNEARY INTERPRETATION: Amino acid 1 is attached by Nic.
COTHER INFORMATION: Amino acid 1 is attached by Nic.
NAME/KEY: BINDING
JUCATION: (7)
COTHER INFORMATION: Amino acid 7 is attached by a hydroxide bond.
NAME/KEY: DISULFID
JUCATION: (3)...(6)
COTHER INFORMATION: Cysteine residues at positions 3 and 6 are
OTHER INFORMATION: Description of Unknown Organism:peptide derivative

-!- FUNCTION: Thiol protease that hydrolyzes proteins, with a preference for Phe or basic residues.

-!- SUBCELLULAR LOCATION: Secreted.

-!- ALLERGEN: Causes an allergic reaction in human. Common symptoms of mite allergy are bronchial asthma, allergic rhinitis and conjunctivitis. Reacts with IgE in 80% of patients with house dust
                                                                                                                                                            SEQUENCE OF 99-127.
